

FBL OHP

Feedback looper

IN / SEND : connect to the output of another module/unit/fx
OUT / RETURN: connect to the input of another module/unit/fx
BYPASS: The bypass switch will stop the loop

The potentiometer will let the amount of feedback pass through.
You don't need to use all IN (SEND) and OUTPUTS (RETURN). Use for example the SEND and RETURN to an effect unit and add some sound to the IN.

For systems with only banana jacks you will need to connect the module to ground via the BROWN banana on the side.
